MIXING

Fentanyl (10mcg/mL):

- 1. Remove 250mcg/5mL ampules of Fentanyl and one 50mL bag of 0.9% Sodium Chloride from the Pyxis machine. PHARMACIST must be called if this concentration is not available.
- 2. Withdraw and discard 10mL from the 50 mL 0.9% Sodium Chloride Bag, leaving 40 mL in the bag. (This is a crucial step for achieving an accurate concentration.)
- 3. Using a Filter Needle, draw 10mL (500mcg) from the Fentanyl ampules. DO NOT INJECT INTO BAG USING FILTER NEEDLE.
- 4. Remove and discard the filter needle, replace with a regular needle, and inject the 10mL (500mcg) Fentanyl into the 0.9% Sodium Chloride Bag.
- 5. Pull Boluses from this infusion bag NOT from Fentanyl vials/ampules.

Midazolam for > 5kg (1mg/mL):

- 1. Remove **10mg/2mL** vials of Midazolam and one 50mL bag of 0.9% Sodium Chloride from the Pyxis machine. PHARMACIST MUST be called if this concentration is not available.
- 2. Withdraw and discard 10mL from the 50mL 0.9% Sodium Chloride Bag and discard, leaving 40mL in the bag. (This is a crucial step for achieving an accurate concentration.)
- 3. Withdraw 10mL (50mg) from the Midazolam vials and inject into the 0.9% Sodium Chloride Bag.
- 4. Pull Boluses from this infusion bag NOT from Midazolam vials/ampules.

PROVIDER DOSING GUIDELINES

All dose adjustments must be ordered by the provider. Post intubation, titrate infusions and dosing to meet patient sedation needs as follows:

- Start Fentanyl infusion and give q15 minute boluses for the first hour. Overlapping boluses and infusions will accelerate achievement of steady state sedation. Midazolam can be started if blood pressure is stable.
- After an infusion has been started and several boluses have been given, reassess the level of sedation. If sedation is not adequate, the rate of infusion can be increased by 25-50% within the range on the table. This will not have an immediate effect, so give a bolus at the same time.
- May give Fentanyl and/or Midazolam boluses every 10-15 minutes (or sooner) as needed.
- If **hypotension is a concern**, hold or lower the Midazolam dose. Fentanyl is less likely to cause hemodynamic changes.
- Boluses should be drawn up or bolused on the pump from pre-mixed bags so the same concentration is ALWAYS used.

REMEMBER:

- Use boluses to rapidly increase the level of sedation.
- Patient will not have an immediate response to infusion rate changes; infusions are meant to maintain a level of sedation.
- May use lower doses of either medication if sedation is adequate.
- Fentanyl, Midazolam, and pressors may be run together in the same line. However, DO NOT give a bolus in the same line as a pressor, as this would bolus the pressor as well.
- Fentanyl and Midazolam are NOT compatible with Bicarbonate.

Dosing Reference:

Fentanyl (10mcg/ml) – bolus dose 1-2 mcg/kg (max dose 50 mcg/bolus); infusion dose range 1-3 mcg/kg/hr. Midazolam (1mg/ml) – bolus dose 0.05-0.1 mg/kg (max dose 2 mg/bolus); infusion dose range 0.05-0.2mg/kg/hr.

Dosing Guidelines: 8–9 kg

MIXING

Fentanyl (10mcg/mL):

- 1. Remove 250mcg/5mL ampules of Fentanyl and one 50mL bag of 0.9% Sodium Chloride from the Pyxis machine. PHARMACIST must be called if this concentration is not available.
- Withdraw and discard 10mL from the 50 mL 0.9% Sodium Chloride Bag, leaving 40 mL in the bag. (This is a crucial step for achieving an accurate concentration.)
- 3. Using a Filter Needle, draw 10mL (500mcg) from the Fentanyl ampules. DO NOT INJECT INTO BAG USING FILTER NEEDLE.
- 4. Remove and discard the filter needle, replace with a regular needle, and inject the 10mL (500mcg) Fentanyl into the 0.9% Sodium Chloride Bag.
- 5. Pull Boluses from this infusion bag NOT from Fentanyl vials/ampules.

Midazolam for > 5kg (1mg/mL):

- 1. Remove **10mg/2mL** vials of Midazolam and one 50mL bag of 0.9% Sodium Chloride from the Pyxis machine. PHARMACIST MUST be called if this concentration is not available.
- 2. Withdraw and discard 10mL from the 50mL 0.9% Sodium Chloride Bag and discard, leaving 40mL in the bag. (This is a crucial step for achieving an accurate concentration.)
- 3. Withdraw 10mL (50mg) from the Midazolam vials and inject into the 0.9% Sodium Chloride Bag.
- 4. Pull Boluses from this infusion bag NOT from Midazolam vials/ampules.

Dosing Reference:

Fentanyl (10mcg/ml) - bolus dose 1-2 mcg/kg (max dose 50 mcg/bolus); infusion dose range 1-3 mcg/kg/hr. Midazolam (1mg/ml) - bolus dose 0.05-0.1 mg/kg (max dose 2 mg/bolus); infusion dose range 0.05-0.2mg/kg/hr.

DRUG		8-9 kg
FENTANYL 10 mcg/mL	Bolus	8 mcg <mark>0.8 mL</mark>
	Infusion	8–27 mcg/hr 0.8–2.7 mL/hr
Bolus MIDAZOLAM 1 mg/mL Infusior	Bolus	0.4 mg <mark>0.4 mL</mark>
	Infusion	0.4–1.6 mg/hr 0.4–1.6 mL/hr

PROVIDER DOSING GUIDELINES

All dose adjustments must be ordered by the provider. Post intubation, titrate infusions and dosing to meet patient sedation needs as follows:

- Start Fentanyl infusion and give q15 minute boluses for the first hour. Overlapping boluses and infusions will accelerate achievement of steady state sedation. Midazolam can be started if blood pressure is stable.
- After an infusion has been started and several boluses have been given, reassess the level of sedation. If sedation is not adequate, the rate of infusion can be increased by 25-50% within the range on the table. This will not have an immediate effect, so give a bolus at the same time.
- May give Fentanyl and/or Midazolam boluses every 10-15 minutes (or sooner) as needed.
- If **hypotension is a concern**, hold or lower the Midazolam dose. Fentanyl is less likely to cause hemodynamic changes.
- Boluses should be drawn up or bolused on the pump from pre-mixed bags so the same concentration is ALWAYS used.

REMEMBER:

- Use boluses to rapidly increase the level of sedation.
- Patient will not have an immediate response to infusion rate changes; infusions are meant to maintain a level of sedation.
- May use lower doses of either medication if sedation is adequate.
- Fentanyl, Midazolam, and pressors may be run together in the same line. However, DO NOT give a bolus in the same line as a pressor, as this would bolus the pressor as well.
- Fentanyl and Midazolam are NOT compatible with Bicarbonate.

Dosing Guidelines: 15-18 kg

MIXING

Fentanyl (10mcg/mL):

- 1. Remove 250mcg/5mL ampules of Fentanyl and one 50mL bag of 0.9% Sodium Chloride from the Pyxis machine. PHARMACIST must be called if this concentration is not available.
- 2. Withdraw and discard 10mL from the 50 mL 0.9% Sodium Chloride Bag. leaving 40 mL in the bag. (This is a crucial step for achieving an accurate concentration.)
- 3. Using a Filter Needle, draw 10mL (500mcg) from the Fentanyl ampules. DO NOT INJECT INTO BAG USING FILTER NEEDLE.
- 4. Remove and discard the filter needle, replace with a regular needle, and inject the 10mL (500mcg) Fentanyl into the 0.9% Sodium Chloride Bag.
- 5. Pull Boluses from this infusion bag NOT from Fentanyl vials/ampules.

Midazolam for > 5kg (1mg/mL):

- 1. Remove 10mg/2mL vials of Midazolam and one 50mL bag of 0.9% Sodium Chloride from the Pyxis machine. PHARMACIST MUST be called if this concentration is not available.
- 2. Withdraw and discard 10mL from the 50mL 0.9% Sodium Chloride Bag and discard, leaving 40mL in the bag. (This is a crucial step for achieving an accurate concentration.)
- 3. Withdraw 10mL (50mg) from the Midazolam vials and inject into the 0.9% Sodium Chloride Bag.
- 4. Pull Boluses from this infusion bag NOT from Midazolam vials/ampules.

PROVIDER DOSING GUIDELINES

All dose adjustments must be ordered by the provider. Post intubation, titrate infusions and dosing to meet patient sedation needs as follows:

- Start Fentanyl infusion and give g15 minute boluses for the first hour. Overlapping boluses and infusions will accelerate achievement of steady state sedation. Midazolam can be started if blood pressure is stable.
- After an infusion has been started and several boluses have been given, reassess the level of sedation. If sedation is not adequate, the rate of infusion can be increased by 25-50% within the range on the table. This will not have an immediate effect, so give a bolus at the same time.
- May give Fentanyl and/or Midazolam boluses every 10-15 minutes (or sooner) as needed.
- If hypotension is a concern, hold or lower the Midazolam dose. Fentanyl is less likely to cause hemodynamic changes.
- Boluses should be drawn up or bolused on the pump from pre-mixed bags so the same concentration is ALWAYS used.

REMEMBER:

- Use boluses to rapidly increase the level of sedation.
- Patient will not have an immediate response to infusion rate changes; infusions are meant to maintain a level of sedation.
- May use lower doses of either medication if sedation is adequate.
- Fentanyl, Midazolam, and pressors may be run together in the same line. However, DO NOT give a bolus in the same line as a pressor, as this would bolus the pressor as well.
- Fentanyl and Midazolam are NOT compatible with Bicarbonate.

Dosing Reference:

Fentanyl (10mcg/ml) – bolus dose 1-2 mcg/kg (max dose 50 mcg/bolus); infusion dose range 1-3 mcg/kg/hr. Midazolam (1mg/ml) – bolus dose 0.05-0.1 mg/kg (max dose 2 mg/bolus); infusion dose range 0.05-0.2mg/kg/hr.

MIXING

Fentanyl (10mcg/mL):

- 1. Remove 250mcg/5mL ampules of Fentanyl and one 50mL bag of 0.9% Sodium Chloride from the Pyxis machine. PHARMACIST must be called if this concentration is not available.
- Withdraw and discard 10mL from the 50 mL 0.9% Sodium Chloride Bag, leaving 40 mL in the bag. (This is a crucial step for achieving an accurate concentration.)
- 3. Using a Filter Needle, draw 10mL (500mcg) from the Fentanyl ampules. DO NOT INJECT INTO BAG USING FILTER NEEDLE.
- 4. Remove and discard the filter needle, replace with a regular needle, and inject the 10mL (500mcg) Fentanyl into the 0.9% Sodium Chloride Bag.
- 5. Pull Boluses from this infusion bag NOT from Fentanyl vials/ampules.

Midazolam for > 5kg (1mg/mL):

- 1. Remove **10mg/2mL** vials of Midazolam and one 50mL bag of 0.9% Sodium Chloride from the Pyxis machine. PHARMACIST MUST be called if this concentration is not available.
- 2. Withdraw and discard 10mL from the 50mL 0.9% Sodium Chloride Bag and discard, leaving 40mL in the bag. (This is a crucial step for achieving an accurate concentration.)
- 3. Withdraw 10mL (50mg) from the Midazolam vials and inject into the 0.9% Sodium Chloride Bag.
- 4. Pull Boluses from this infusion bag NOT from Midazolam vials/ampules.

Start Fentanyl infusion and give q15 minute boluses for the first hour. Overlapping boluses and infusions will accelerate achievement of steady state sedation. Midazolam can be started if blood pressure is stable.

PROVIDER DOSING GUIDELINES

patient sedation needs as follows:

• After an infusion has been started and several boluses have been given, reassess the level of sedation. If sedation is not adequate, the rate of infusion can be increased by 25-50% within the range on the table. This will not have an immediate effect, so give a bolus at the same time.

All dose adjustments must be ordered by the provider. Post intubation, titrate infusions and dosing to meet

- May give Fentanyl and/or Midazolam boluses every 10-15 minutes (or sooner) as needed.
- If **hypotension is a concern**, hold or lower the Midazolam dose. Fentanyl is less likely to cause hemodynamic changes.
- Boluses should be drawn up or bolused on the pump from pre-mixed bags so the same concentration is ALWAYS used.

REMEMBER:

- Use boluses to rapidly increase the level of sedation.
- Patient will not have an immediate response to infusion rate changes; infusions are meant to maintain a level of sedation.
- May use lower doses of either medication if sedation is adequate.
- Fentanyl, Midazolam, and pressors may be run together in the same line. However, DO NOT give a bolus in the same line as a pressor, as this would bolus the pressor as well.
- Fentanyl and Midazolam are NOT compatible with Bicarbonate.

Dosing Reference:

Fentanyl (10mcg/ml) - bolus dose 1-2 mcg/kg (max dose 50 mcg/bolus); infusion dose range 1-3 mcg/kg/hr. Midazolam (1mg/ml) - bolus dose 0.05-0.1 mg/kg (max dose 2 mg/bolus); infusion dose range 0.05-0.2mg/kg/hr.
