

# Clinical Guideline **Burns (Adult and Pediatric)**

### Severe Criteria

- Circumferential burns
- Burns across joints
- Burns of face, neck, or groin
- Electrical/chemical burns
- Inhalation injuries/respiratory distress
- Trauma (refer to ATLS)
- Any full-thickness (3rd degree) burns

#### Disposition Considerations/Criteria

Village: wound care by health aides over RMT, consider PT by telehealth.

- Pain controlled on PO regimen.
- No sign of wound infection.
- · Unlikely to require further debridement.
- Patient/caregiver/health aide able to perform dressing changes.

Outpatient (ED/Outpatient Clinic/PT): daily follow-up for wound management and ROM exercises.

- · Wound infection improving on PO antibiotic regimen.
- Debridement not more than once/day.
- · Dressing changes not more than twice/day.
- Need for PT assessment not more than twice/week.

#### Inpatient YKHC:

- Pain uncontrolled on oral medications.
- Dressing changes more than twice/day.
- Wound infection requiring IV antibiotics.
- Nonambulatory (including wounds on both feet).

#### Inpatient ANMC:

- · Critical illness.
- · Wound requiring operative debridement or grafting.
- · Surgeon recommends higher level of care.
- · Child with severe criteria.

· If expected wound care exceeds currently available resources at YKHC.

#### Modified Brooke/Parkland Formula

Determine disposition. See Box.

Only used if TBSA >15% in adults or >10% in children.

If any concern for abuse, send a

message to Child Abuse on Call

by Tiger Connect.

(weight in kg) x 2-4 mL x %TBSA = total fluid to be given over 24 hours Do not convert %TBSA to a decimal. For example, 15% TBSA would be 15.

Give half in first eight hours from time of burn. Give other half over the next sixteen hours.

LR to be used unless mitigating circumstances.

## Classification of Burns by Depth

Burns evolve over time; initial TBSA and depth classification can change and often the difference between deep partial thickness and full thickness can only be determined operatively.

- Superficial (1st degree): epidermis only, dry, red, blanches with pressure, no blisters, painful.
- Superficial partial-thickness (2<sup>nd</sup> degree): epidermis and part of dermis, blisters, moist, red, weeping, blanches with pressure, painful.
- Deep partial-thickness (2<sup>nd</sup> degree): epidermis and deep dermis, blisters, wet or waxy dry, patchy white to red, does not blanch, pressure sensation only.
- Full-thickness (3<sup>rd</sup> degree): epidermis and entire dermis, waxy white to leathery gray to charred/black, dry and inelastic, does not blanch, sensation to deep pressure only, may be defined as 4<sup>th</sup> degree with extension into underlying fascia, muscle, or bone.

This guideline is designed for the general use of most patients but may need to be adapted to meet the special needs of a specific patient as determined by the medical practitioner. Approved by MSEC 12/2/20. Click <a href="here">here</a> to see the supplemental resources for this guideline. If comments about this guideline, please contact Travis\_Nelson@ykhc.org.
